

IT user stories:

- As IT I want to have user feedback sources so that I can find and fix bugs more easily.
- As IT I want to have a help section to resolve user issues that aren't website issues
- As IT I want to have access to logs to find issues and resolve them
- As IT I want to be able to temporarily shut down the website to fix problems.
- As IT I want to be able to notify users of potential changes to the website.

Functional requirements:

- Quickly turning server for website on and off.
- Read user requests for changes and bugfixes (Either on website or an outside source)
- "Potentially": Prevent users without an account from accessing the website after a couple uses.
